DUPONT BIOMATERIALS
Growing Jobs and Rural Economies: The Farm Bill’s Energy Title

John Sagrati – Business Development Manager, DuPont Industrial Biosciences
RETHINK RENEWABLE PERFORMANCE

DuPont Biomaterials’ differentiated value proposition

INNOVATIVE SCIENCE
→ HIGH PERFORMANCE

SCALABLE SUPPLY
→ ACCESSIBLE & AFFORDABLE

RENEWABLE SOURCING
→ RESPONSIBLE BIOMATERIALS
RENEWABLY SOURCED 1,3 PROPANEDIOL
Responsible Materials

Need to be genuinely responsible
  Environmentally
  Socially

Need to be identifiable

Need to be publicized/promoted

USDA BIOPREFERRED

Sorona™ renewably sourced fiber is one of the first 11 products approved as part of the United States Department of Agriculture (USDA) BioPreferred Program for certified bio-based products.

@DuPontBiobased

DuPont
SORONA® & BIO-PDO™

- Bio-PDO™ from DuPont Tate & Lyle Bioproducts JV is made from industrial dent corn starch.

- Sorona® polymer is used in carpets and apparel fabrics.

- Bio-PDO™ is used in consumer (cosmetics, food & flavors, laundry) and industrial products (polyurethanes, heat transfer fluids).
Sorona® Polymer Benefits

The molecular structure and crystalline morphology gives Sorona® unique properties in textile fibers.

- Sorona® is bio-based PTT (polytrimethyleneterephthalate), made in part from renewable feedstock.
- U.S. FTC granted a new generic (triexta) for Sorona® in 2009, based on the unique combination of attributes and benefits.
- Properties differ from other existing fibers, combining many of the best benefits into a single product.
OUR JOURNEY CREATING BIOMATERIALS FOR HIGH-PERFORMANCE PRODUCTS

Our Challenge: How do we build a regenerative economy where 9.7 billion people can thrive? Let’s Solve.

We begin with efficient, renewable industrial crops from already cultivated land.

Only source sugar from increasingly efficient industrial crops grown on already cultivated land.

For centuries, society has used land to grow other valuable products, with less than 1/3 of global arable land used to grow food (only 0.01% used for advanced biomaterials).

We use the plant’s most efficient natural energy source: sugar.

Nature uses photosynthesis to efficiently make sugar.

We lower our footprint by using only the naturally efficient sugars (from 1st generation feedstock), leaving the rest of the plant for other products.

DuPont is a leader in advancing technologies to extract sugars from 2nd generation crop residue.

We use innovative science to turn these crops into high-performance materials.

We use patented scientific expertise turn the sugars into unique, high-performance materials.

Thanks to our research, these renewable polymers are used to make advanced, responsible products.

We build an integrated supply chain to scale these performance polymers.

We deliver advanced biomaterials and then train all value chain partners in how to best use them.

This helps create more accessible, renewable products that perform better.

DuPont biomaterials improve products for good to build a bioeconomy that will last.
WE CONSIDER A RANGE OF IMPORTANT, INTER-CONNECTED SUSTAINABILITY FACTORS TO DELIVER INNOVATIVE TECHNOLOGIES

“Sweet spot” for new technology development and scaling the bioeconomy for 9.7 billion people to thrive
WE USE LESS THAN A THIRD OF GLOBAL ARABLE LAND TO GROW FOOD AND FOR CENTURIES WE’VE USED LAND TO GROW OTHER VALUABLE PRODUCTS

We use 80 times more arable land to make paper than high-performance biomaterials.

(Not to mention 30 times more land for cotton, 4x more for tobacco and 500x more for wood products.)

Sample Case Study: The Impact of Sorona® on Land Use Is Minimal

Land Needed to Grow Corn for Sorona® in One Car:

- We can make two car mats from Sorona® made with corn grown on land the size of one mat.

  - Premise: 2,400g Sorona®.
  - Requires sugars from 2.7 M² of farmland, for one growing season. The other parts of the corn grown from the same land produce a range of other valuable bi-products.

Land Needed to Grow One 50%Sorona®/50% Cotton T-Shirt:

- We can make more than 11 Sorona® shirts or one cotton shirt from on the same amount of land (Sorona® is 11.5 times more land-efficient than cotton).

  - Premise: 67g Sorona® (1/2 shirt), 186g of cotton (1/2 shirt).
  - Sorona® production requires sugars from <0.1 M² of farmland, for one growing season. The other parts of the corn grown from the same land produce a range of other valuable bi-products.
  - Cotton production requires 1.17 M² of farmland, for one growing season.

**1<sup>ST</sup> GENERATION IS THE MOST RESOURCE EFFICIENT, RENEWABLE FEEDSTOCK**

Our Challenge: How do we build a regenerative economy where 9.7 billion people can thrive? *Let’s Solve.*

Among the crops grown to produce materials, annually renewable starch crops are the most (1) resource-efficient, (2) high-performing and (3) scalable in order to produce biomaterials accessible to everyone.

- Requires fewer natural resources (land, water, energy, fertilizers) to grow
- High performance & scalable using existing technology
- Wide variety of applications
- Uses only sugars leaving the rest of the plant for valuable bi-products

- More resource intensive, including high water and energy use
- More land needed
- Lower performance
- Limited applications

- Non-renewable with significant environmental and public health impacts from extraction and use
- Recycling fossil fuels is valuable but has limited applications
DUPONT BIOMATERIALS USE THE STARCH FROM INDUSTRIAL CROPS LIKE YELLOW DENT CORN AND SUGAR BEET. THE REST OF THE PLANT IS USED FOR OTHER VALUABLE PRODUCTS

Yellow Dent Corn Components:
- 62% Starch
- 19.2% Protein & Fiber
- 15% Moisture
- 3.8% Corn Oil

One bushel of wet-milled yellow dent corn produces

1.5 pounds of crude corn oil
- Used in consumer & industrial products

13.5 pounds of gluten feed
- Used in animal feed

2.6 pounds of gluten meal
- Used in animal feed

31.5 pounds of starch
- Used as the feedstock for DuPont Sorona®
